Experience

Atlassian

Lead Backend Engineer, Mobile Security Team

San Francisco, CA

2025 – Present

- Served as service owner and most senior backend engineer on the team, owning design review and approval for backend work while cross-training 3 engineers moving from mobile into backend development.
- Drove backend design and delivery for a Microsoft Intune Mobile Application Management (MAM) integration, implementing a new policy type that reused the existing policy-retrieval flow to minimize backend overhead; now enabled by 283 organizations covering 417K+ end users, unlocking 40K+ licenses at a major enterprise customer.
- Nearly doubled mobile security policy adoption, from 15% to 27.2%, by designing the backend flow and implementation plan for automatically provisioning baseline security policies to eligible organizations.
- Led the end-to-end migration of the mobile security backend service off AWS EKS onto an internal Kubernetes platform, authoring the Helm and service configuration and consolidating legacy regions with zero service downtime while improving reliability and observability.
- Owned all implementation across 5 backend and frontend services and aligned product and design on the team's migration onto a new AI-native policy platform, after leading the architecture review that showed it would provide group-based policy targeting natively, avoiding a three-month build of a custom evaluation system.
- Ran company-wide new-hire onboardings and moderated leadership Q&A sessions, helping hundreds of new employees from interns to highly experienced hires ramp up and connect with company leadership.

Atlassian

Software Engineer II, Mobile Security Team

San Francisco, CA

2023 – 2025

- Served as feature lead for a real-time, SQS-based push notification pipeline spanning 6 backend services, building the notification endpoint and event ingestion layer to resolve a production issue open since 2021 where mobile security policy updates took up to 7 days to reach devices; now delivers 150K+ notifications monthly in near-real time.
- Delivered a mobile browser access-control feature unlocking 80K+ device licenses at a major enterprise customer, rapidly ramping up on Rego (Open Policy Agent) and leading the performance and end-to-end testing required for rollout.
- Served as backend subject-matter expert and lead code reviewer for migrating the mobile security service, covering 2.3M paid users, onto an isolated cloud offering (dedicated infrastructure for regulated and privacy-sensitive customers).
- Partnered with recruiting on campus and conference hiring, career fairs, and technical interview workshops, speaking with 1,500+ candidates, including 1,000+ one-on-one conversations at the Grace Hopper Celebration; maintained one of the highest interview counts in the org.

Atlassian

Software Engineer I, Mobile Security Team

San Francisco, CA

2022 – 2023

- Implemented the backend for a mobile IP allowlist bypass feature serving ~25K monthly active users, enabling enterprise administrators to exempt managed mobile devices from IP-based access restrictions; built and configured the continuous integration test suite covering the feature.
- Led the integration of DangerJS into the team's primary backend service, automating repetitive code review checks to surface issues earlier and cut reviewer turnaround time.
- Mentored a summer intern throughout their internship, including regular 1:1s, code reviews, and technical guidance; then carried their project to delivery across multiple teams' services, shipping support for multiple mobile security policies per org, adopted by 19 organizations within a month.

Amazon

Software Development Engineer, Prime Video

Los Angeles, CA

Summer 2020 & 2021

- Designed and implemented a banner management system backed by a DynamoDB datastore for Prime Video's partner website, replacing a hard-coded process and cutting the time to add a new banner from 6–9 hours to a couple of minutes.
- Built a chatbot using Amazon Lex, AWS Lambda, and Elasticsearch to answer partner questions about title upload status in natural language, with full unit and integration test coverage, and shipped the feature to production.

Education

University of California, Berkeley

B.A. Computer Science & B.A. Mathematics

Regents' and Chancellor's Scholar (top <2% of admitted students)

Berkeley, CA

2018 – 2022

Skills

Languages: Kotlin, Java, Python, SQL, TypeScript, JavaScript, C#

Security & Identity: OAuth 2.0 / OIDC, Open Policy Agent (Rego), HashiCorp Vault, MDM/MAM policy enforcement

Backend & Infrastructure: Spring Boot, REST APIs, Kubernetes, EKS, Helm, Docker, CI/CD

Cloud, Data & Observability: AWS, GCP, DynamoDB, SQS, Splunk, Amplitude

Natural Languages (Native): English, Russian
